

Project Design Phase
Problem – Solution Fit Template

Date	20 JUNE 2026
Team ID	INDIVIDUAL PROJECT
Project Name	Online Complaint Registration and Management System
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The target users of the Online Complaint Registration and Management System include citizens, customers, and organizations who need a simple and reliable way to register and track complaints. Many existing complaint systems rely on manual processes, making it difficult for users to know the status of their complaints. Delayed responses, poor communication, and the absence of transparent complaint tracking often lead to frustration and dissatisfaction. In addition, weak authentication mechanisms and scattered complaint records reduce user trust and overall system efficiency.

Designing the Solution and Adoption Strategy

To address these challenges, the system provides a secure web-based platform where users can register complaints, monitor their progress in real time, and receive updates from assigned agents. Administrators can efficiently manage complaints, assign them to appropriate agents, and monitor overall complaint resolution. The system implements JWT-based authentication, role-based access control, and a responsive MERN stack interface to ensure secure access and a user-friendly experience. These features encourage users to adopt a digital complaint management process with greater confidence.

Communication Channels and Behaviour Triggers

Users expect a complaint system that is easy to access, transparent, and responsive. The platform encourages engagement by providing instant complaint registration, status tracking, and clear communication between users, agents, and administrators. Real-time status updates and secure login mechanisms build user confidence and motivate users to rely on the platform instead of traditional manual complaint methods.

Eliminating Annoyances and Urgent Problems

The proposed system removes common challenges such as paperwork, delayed complaint processing, and lack of complaint visibility. By digitizing the entire complaint lifecycle, users can monitor complaint progress at every stage while administrators and agents can efficiently manage assignments and updates. This results in faster complaint resolution, improved transparency, enhanced security, and greater user satisfaction, making the system an effective solution for modern complaint management.
